Title: Perfect score: SEQ4-103-117-14 6847 1 MELAALCRWGLLL

Sequence: MELAALCRWGLLLALLPPGA.....TFKGTPTAENPEYLGLDVPV 1261

Scoring table: BLOSUM62 Gapop 10.0 ,

Gapext 0.5

112892 seqs,

41476328 residues

Total number of hits satisfying chosen parameters: 112892

Minimum DB Maximum DB seq length: 0 seq length: 2000000000

Post-processing: Minimum Match 0%
Maximum Match 100%
Listing first 45 summaries

Database :

SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: ESSENTIAL COMPONENT OF A NEUREGULIN-RECEPTOR COME
ALTHOUGHT NEUREGULINS DO NOT INTERACT WITH IT ALONE. GP30 1
POTENTIAL LIGAND FOR THIS RECEPTOR. NOT ACTIVATED BY EGF, 1
ALPHA AND AMPHIREGULIN.
CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protei
tyrosine phosphate.
Tyrosine phosphate.
SUBUNIT: HETERODIMER WITH EACH OF THE OTHER ERBB RECEPTORS.
THE CONSTITUTIVELY ACTIVATED ONCOGENIC VARIANT FORMS A HOME
SUBCELLULAR LOCATION: Type I membrane protein.
PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE
RESIDUES (BY SIMILARITY).

Rev. Biochem. 56:881-914(1987).

FUNCTION: Receptor for EGF, but also for other members of the FEMCTION: Receptor for EGF, but also for other members of the Femily, as TGF-alpha, amphiregulin, betacellulin, heparin-bindi EGF-like growth factor. GP30 and vaccinia virus growth factor. involved in the control of cell growth and differentiation. FUNCTION: Isoform 2/truncated isoform may act as an antagonist. CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.

SUBCELLULAR LOCATION: Type I membrane protein. Isoform 2 is
                                                                                                                                                                            expressed in ovarian cancers.

MISCELLANEOUS: Binding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complinduction of the tyrosine kinase activity, stimulation synthesis, and cell proliferation.

SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                       ALTERNATIVE PRODUCTS: 4 isoforms; 1/p170 (struncated isoform/TEGFR, 3/p110 and 4; are alternative splicing.
TISSUE SPECIFICITY: Expressed in placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             epidermal growth factor receptor

SUBCELLULAR LOCATION: Type I membrane protein.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; JM-A, (SHOWN HERE) AND JM-B;
ARE PRODUCED BY ALTERNATIVE SPILICING. THE TWO ISOFORMS DIFFER
FUNCTIONALLY IN THEIR RESPONSE TO PHORBOL ESTER: JM-A IS PROCESSED
BUT NOT JM-B. SO, THEY RESPECTIVELY REPRESENT CLEAVABLE AND
NONCLEAVABLE FORMS OF THE RECEPTOR. BOTH ISOFORMS ARE EXPRESED IN
CEREBELLUM, BUT ONLY THE JM-B ISOFORM IS EXPRESSED IN THE HEART.

KIDNEY, IN ADDITION TO SKELETAL MUSCLE, PARATHYROID, CEREBELLUM,
PITULTARY, SPLEEN, TESTIS AND BREAST: LOWER LEVELS IN THYMUS,
LUNG, SALIVARY GLAND, AND PANCREAS.

LUNG, SALIVARY GLAND, AND PANCREAS.

PROCESSED FOR THYMUS,
DESCRIPTION ON TYROSINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: SPECIFICALLY BINDS AND IS ACTIVATED BY NEUREGULINS, NRG-
2, NRG-3, HEPARIN-BINDING EGF-LIKE GROWTH FACTOR, BETACELIULIN AND
NTAK. INTERACTION WITH THESE FACTORS INDUCES CELL DIFFERENCIATION.
NOT ACTIVATED BY EGF, TGF-A, AND AMPHIREGULIN.
CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tyrosine phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: PREFERENTIALLY EXPRESSED IN THE DEVELOPING
TISSUE SYSTEM. EXHIBITS DISTINCT AND HIGHLY REGIONALIZED PATTI
OF EXPRESSION IN THE ADULT BRAIN, WHERE IT IS MAINLY FOUND IN T
RETICULAR NUCLEUS OF THE THALLAMUS. VERY LOW LEVELS IN KIDNEY,
HEART.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  tyrosine phosphate.
SUBUNIT: HOMODIMER OR HETERODIMER WITH EACH OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                2, NRG-3, HEPARIN-BINDING EGF-LIKE GROWTH FACTOR, BETACELLULIN AND NTAK. INTERACTION WITH THESE FACTORS INDUCES CELL DIFFERENCIATION. NOT ACTIVATED BY EGF, TGF-A, AND AMPHIREGULIN (BY SIMILARITY). CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                    SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.

SECRETED (SHORT FORM).

-I- ALTERNATIVE PRODUCTS: TWO FORMS, A LONG TRANSMEMBRANE FORM AN SHORT SECRETED FORM, EXIST DUE TO ALTERNATIVE SPLICING.

-I- TISSUE SPECIFICITY: EPITHELIAL TISSUES AND BRAIN.

-I- DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITS SH2 OR SH3 DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.

-I- PTM: LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RES AND PROMOTES ITS ASSOCIATION WITH THE P85 SUBUNIT OF PHOSPHATIDYLINOSITOL 3-KINASE (BY SIMILARITY).

-I- DISEASE: OVEREXPRESSED IN A SUBSET OF HUMAN MAMMARY TUMORS.

-I- SIMILARITY: BELONGS TO THE EGF RECEPTOR FAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TYPOSINE PHOSPHATE.

MISCELLANEOUS: THIS PROTEIN IS PRODUCED BY ERYTHROLEUKEMIA CELLS IN CHICKS WHICH HAVE BEEN INJECTED WITH THE AVIAN LEUKOSIS VIRUS IN SUBSEQUENTLY DEVELOP LEUKEMIA. THE LEUKEMIAS ARE INDUCED BY THE INSERTION OF RETROVIRAL PROMOTER ELEMENTS IN OR NEAR THE C-ERBB GENE, WHICH LEADS TO C-ERBB ACTIVATION.

MISCELLANEOUS: THIS PROTEIN IS SYNTHESIZED AS A GAG-ENV-ERBB
